

DAY 2

Excel Tables

Aaj hum seekhenge ki normal data range ko Excel Table me kaise convert karte hain. Tables data ko organised, filterable aur formulas ke liye easy bana dete hain.

Table Kya Hai aur Kyun Use Kare

- Table data ko ek structured format deta hai: header row, banded rows aur auto-expanding range.
- Naya data neeche add karte hi table apne aap expand ho jata hai aur formulas auto-fill hote hain.
- Table ko naam de sakte ho (Table Design > Table Name), jaise SalesData.

Table Banana aur Customize Karna

- Data me kahi bhi click karo aur Ctrl + T dabao (My table has headers tick rakho).
- Table Design tab se style, banded rows, header row, total row aur filter button on/off karo.
- Convert to Range se table wapas normal range ban jata hai.

Sort, Filter aur Data Cleaning

- Header ke dropdown se A to Z, Z to A aur custom sort kar sakte ho.
- Filter: text filter, number filter, date filter aur color filter.
- Remove Duplicates: Data > Remove Duplicates se repeated rows hatao.
- Freeze Panes (View tab) se header row scroll karte waqt bhi dikhti rehti hai.
- Slicer: Table Design > Insert Slicer se button-style filter.

Structured References

- Cell address ki jagah column ka naam use hota hai, jo formula ko padhna aasan bana deta hai.
- `[@Column]` ka matlab current row ki value hota hai.

Important Formulas / Shortcuts

Formula / Shortcut	Kaam (Purpose)
<code>=[@Price]*[@Qty]</code>	Har row ka total (calculated column)
<code>=SUM(SalesData[Amount])</code>	Poore column ka sum
<code>=SUBTOTAL(109, SalesData[Amount])</code>	Sirf filtered (visible) rows ka sum
<code>=AVERAGE(SalesData[Amount])</code>	Column ka average
Ctrl + T	Table banao
Ctrl + Shift + L	Filter on/off
Alt + Down Arrow	Filter dropdown open

Practice Tasks

1. Sales ka data (Date, Product, Qty, Price) type karo aur Ctrl + T se table banao.
2. Table ko SalesData naam do aur ek Total column add karo ([@Qty]*[@Price]).
3. Total Row on karke sum dikhao.
4. Product ke basis par filter karo aur Amount ke hisaab se sort karo.

Pro Tip: Table me formula ek baar likhte hi poore column me apne aap fill ho jata hai. Manually drag karne ki zaroorat nahi.
